Empathy Map

In this project, the empathy map is used to understand the experiences and expectations of bank credit analysts, compliance officers, and prospective customers. It highlights their challenges in the credit card approval process, such as manual screening, lengthy processing times, and uncertainty in decision-making. These insights guide the development of a machine learning-based credit card approval system that provides faster, more accurate, and consistent approval predictions while improving the overall user experience.

Says

- 'I need to review applications quickly without compromising accuracy.'
- 'I want a reliable system that helps me identify eligible and high-risk applicants.'
- Manual verification takes too much time and increases the chance of errors.

Thinks

- Is this applicant likely to repay the credit card dues?
- Am I following the bank's credit policy and guidelines correctly?
- Can I trust the prediction provided by the system?

Does

- Reviews applicant's personal and financial information.
- Verifies documents and checks credit history.
- Evaluates risk and decides whether to approve or reject the application.

Feels

- Pressured to process a large number of applications.
- Concerned about approving high-risk applicants.
- Satisfied when the system helps in accurate and consistent decisions.
